Dear Capital One Hiring Team,

Your Generative AI platform mandate calls for a player-coach who can guide engineers while remaining close to architecture, quality, and production operations. That combination has defined my recent work: building responsible AI platforms, forming strong teams, and turning ambiguous requirements into reliable systems.

At Intelligent DataWorks, I architected and built the core of AssistX, a production platform supporting 70+ AI automations across more than 20 workflows. I recruited and led 11 engineers while owning model integration, AI agents, RAG and vector search, Python services, AWS deployment, and operations. I also implemented synthetic-data testing, LLM-as-judge evaluation, automated guardrails, observability, and model abstraction that lets the platform right-size models and control token cost.

Previously, I advised more than 200 AWS enterprise customers on AI/ML and scalable cloud architecture and developed global communities that trained 180+ solution architects. At MassMutual, I helped define Responsible AI controls spanning transparency, bias, drift, monitoring, human oversight, and auditability.

Intelligent DataWorks is pursuing a strategic acquisition, and I am seeking a long-term operating role elsewhere. I would welcome a conversation about bringing this mix of hands-on AI engineering, platform judgment, and people leadership to your team in Cambridge.

Sincerely,
Keith Steward
